Dream in Progress

Research & Planning Document — Young Entrepreneur Stories

Project summary

Dream in Progress is a proposed accessible storytelling microsite featuring the early journeys of young entrepreneurs. It is designed to help students and aspiring founders learn from the questions, experiments, setbacks, and lessons behind a business idea.

Purpose and audience

The purpose is to present entrepreneurial stories in an engaging and inclusive format using semantic HTML, responsive layouts, and accessible media alternatives. The primary audience is young people, university students, and aspiring entrepreneurs.

Information architecture

The microsite has three connected pages: Home (story library), Story Detail (one featured story with a transcript and lessons), and About / Access (mission and accessibility features). The primary navigation is available on every page.

Content plan

The Home page introduces the project and displays story cards. The Story Detail page presents one story in a readable article format, with a transcript and practical takeaways. The About / Access page explains the project mission and describes accessibility choices.

Visual design direction

The proposed visual identity uses a warm cream background, dark green text, and lime accents. Editorial typography, generous spacing, clear buttons, and story photography support an approachable, contemporary feel. CSS Grid is used for story cards; Flexbox is used for navigation and grouped content.

Accessibility plan

The prototype includes semantic landmarks, a skip link, visible keyboard focus, descriptive image alternatives, a written transcript, responsive layouts, and a reduced-motion preference. Final testing should include keyboard-only navigation, screen-reader review, and contrast checks against WCAG 2.1 AA. If video is added, captions should be supplied with a track file.

Research still to complete

Before final submission, add sources about accessible media storytelling, WCAG guidance, and youth entrepreneurship; cite them in the final report. If using real people, conduct interviews with consent and verify

quotes. Any fictional content must remain clearly labelled as illustrative.

Evaluation and testing plan

Test the three pages at mobile, tablet, and desktop widths; verify navigation and links; test all focus states; check contrast ratios; validate HTML; and confirm that all audio/video content has a transcript or captions. Record actual results after testing rather than claiming tests have passed before they are completed.

Student project starter — personalize this document and add cited research before submitting.
